

Shareholding Pattern — RAG Knowledge Base Description

Stage Name

Shareholding Pattern

Shareholding Pattern is a stage in the GRO Micro Sales (GMSS) loan application journey used to capture the ownership/shareholding details of the Main Applicant when the Main Applicant is a **Company or Firm**.

The stage is applicable only when the Main Applicant is classified as a **Company or Firm**. It is **not applicable to an Individual or Trust** applicant.

The Shareholding Pattern stage appears after the **Income Verification (IV) Group** stage and before **Pending Documents For Login** in the application tracker.

The purpose of this stage is to capture the details of the shareholders who collectively represent the required **51% shareholding** for file login. The application does not restrict the number or frequency of shareholders that can be added. Multiple shareholders can be entered as required to capture the relevant ownership information.

A shareholder does **not** necessarily have to be a Co-Applicant. The system separately captures whether each shareholder is a Co-Applicant through the **Is Co-Applicant** field.

Shareholding Percentage Requirement

For the application to proceed towards **file login**, the Shareholding Pattern should represent **51% shareholding**.

The screen explicitly displays the instruction:

"Shareholding Percentage should be 51% for file login."

The 51% requirement relates to the shareholding information being captured in this stage. The user can add multiple shareholders to represent the required shareholding.

There is **no restriction on the number of shareholders** that may be added. Therefore, the required 51% may be represented through one shareholder or multiple shareholders, depending on the actual ownership structure.

For example, if three shareholders hold 17%, 17%, and 18%, their combined shareholding is 52%. The system displays each shareholder separately along with their individual shareholding percentage.

The RAG model should not assume that the shareholder count is fixed.

Add Shareholder

The **ADD SHAREHOLDER** action allows the user to add a shareholder to the Shareholding Pattern.

Each shareholder is captured as an individual record. The user can add multiple shareholder records as required.

The Shareholding Pattern screen provides the ability to:

- Add a shareholder.
- View shareholder information.
- Edit an existing shareholder.
- Delete an existing shareholder.

The shareholder list displays information including the shareholder's **Name, Applicant status, Designation, and Shareholding Percentage**.

Shareholder Fields

When the user selects **ADD SHAREHOLDER**, an Add Shareholder form is displayed.

Name

Name is a mandatory field.

The user must enter the name of the shareholder.

The field is displayed with an asterisk, indicating that it is mandatory.

Designation

Designation is a mandatory dropdown field.

The user must select the applicable designation of the shareholder.

The screenshot confirms that Designation is a dropdown and is mandatory. The exact list of available designation values is not defined in the provided source and therefore should not be assumed by the RAG model.

Shareholding %

Shareholding % is a mandatory field.

The user must enter the percentage of ownership/shareholding held by that particular shareholder.

Each shareholder's shareholding percentage is captured separately.

The Shareholding Pattern stage requires the relevant shareholder information to represent the required **51% shareholding for file login**.

Is Co-Applicant

Is Co-Applicant is a mandatory Yes/No field.

The user must specify whether the shareholder is also a Co-Applicant.

Available options shown in the screen are:

Yes

or

No

A shareholder does **not** have to be a Co-Applicant. Therefore, selecting **No** for Is Co-Applicant is valid when the shareholder is not a Co-Applicant.

The RAG model must not state that every shareholder needs to be added as a Co-Applicant.

Mobile Number

Mobile Number is a mandatory field.

The user's mobile number must be entered for the shareholder.

The screenshot shows this field as mandatory.

No additional mobile-number validation rule is specified in the provided source, so the RAG model should not invent a specific format or validation requirement.

Is Mobile Number Linked to Aadhaar

Is mobile number Linked to Aadhaar is a mandatory Yes/No field.

The user must specify whether the shareholder's mobile number is linked to Aadhaar.

Available options shown are:

Yes

or

No

The RAG model should treat this as a mandatory information field and should not assume that the answer must always be Yes.

KYC Required

The Add Shareholder screen displays:

KYC Required: No

Based on the provided screen, KYC is shown as **not required** for the shareholder in this flow.

The RAG model should not convert this into a general KYC rule for other stages or other applicant types unless supported by separate process documentation.

Upload Document

Upload Document is shown as a mandatory field in the Add Shareholder form.

The shareholder record requires a document to be uploaded.

The provided screenshot confirms that the document upload field is mandatory, but it does not specify the exact document type or list of acceptable documents. Therefore, the RAG model should not invent a specific document type.

If a user asks "**Which document should I upload for Shareholding Pattern?**", the available source only confirms that document upload is mandatory; the exact document type is not defined in the supplied material.

Editing and Deleting Shareholders

Each shareholder record displayed in the Shareholding Pattern list has an **Edit** action and a **Delete** action.

The Edit action allows the entered shareholder information to be modified.

The Delete action allows an existing shareholder record to be removed.

When shareholders are added or removed, the overall shareholding information should continue to satisfy the required **51% shareholding for file login**.

Applicant-Type Applicability

The Shareholding Pattern stage is conditional on the Main Applicant type.

Company Main Applicant → Shareholding Pattern applicable.

Firm Main Applicant → Shareholding Pattern applicable.

Individual Main Applicant → Shareholding Pattern not applicable.

Trust Main Applicant → Shareholding Pattern not applicable.

The RAG model should determine the Main Applicant type before explaining or asking for Shareholding Pattern information.

If the user asks why Shareholding Pattern is not appearing, the model should first check whether the Main Applicant is an **Individual, Company, Firm, or Trust**.

Relationship Between Shareholder and Co-Applicant

A shareholder and a Co-Applicant are not the same concept.

A shareholder is captured to represent the ownership/shareholding structure of the Company or Firm.

A Co-Applicant is an applicant associated with the loan application.

The Shareholding Pattern form separately asks:

"Is Co-Applicant?"

Therefore, a shareholder can be:

Shareholder + Co-Applicant

or

Shareholder + Not a Co-Applicant

The RAG model must not assume that being a shareholder automatically makes the person a Co-Applicant.

RAG Decision Rules

When a user asks about Shareholding Pattern, the chatbot should follow these rules:

1. First determine the **Main Applicant type**.
2. If the Main Applicant is a **Company or Firm**, Shareholding Pattern is applicable.
3. If the Main Applicant is an **Individual or Trust**, Shareholding Pattern is not applicable.
4. There is no fixed restriction on the number of shareholders that can be added.
5. The Shareholding Pattern is intended to capture the relevant shareholders representing the required **51% shareholding for file login**.
6. Each shareholder is captured as a separate record.
7. A shareholder does not have to be a Co-Applicant.
8. **Is Co-Applicant** must be captured separately as Yes or No.
9. Name, Designation, Shareholding %, Is Co-Applicant, Mobile Number, Is Mobile Number Linked to Aadhaar, and Upload Document are shown as mandatory fields in the Add Shareholder form.
10. KYC Required is displayed as **No** in the provided screen.
11. The exact designation options and exact document type required for upload are **not specified in the supplied source** and should not be invented by the chatbot.
12. The Shareholding Pattern stage occurs after **Income Verification (IV) Group** and before **Pending Documents For Login**.

RAG Terminology and Query Understanding

The following terms should be treated as related to the Shareholding Pattern stage:

Shareholding Pattern, Shareholding, Shareholder, Shareholding %, Shareholding Percentage, Shareholder Details, Ownership Pattern, Ownership Details, Shareholder Details, Add Shareholder, Sourcing Business Name (SBN)? — No. SBN is unrelated to Shareholding Pattern and should not be mapped to this stage.

Common user queries may include:

- "What is Shareholding Pattern?"
- "What is the shareholding pattern stage?"
- "When does Shareholding Pattern appear?"
- "For which applicants is Shareholding Pattern applicable?"
- "Is Shareholding Pattern applicable for individual?"

- "Is Shareholding Pattern required for company?"
- "Is Shareholding Pattern required for firm?"
- "Is Shareholding Pattern required for trust?"
- "How many shareholders can I add?"
- "Is there any limit on number of shareholders?"
- "Do I need to add all shareholders?"
- "Why do we need 51% shareholding?"
- "How much shareholding is required for file login?"
- "Does shareholder have to be co-applicant?"
- "Can shareholder be non-co-applicant?"
- "What is Is Co-Applicant in Shareholding Pattern?"
- "What details are required for shareholder?"
- "What fields are mandatory in Add Shareholder?"
- "Can I edit shareholder details?"
- "Can I delete a shareholder?"
- "What document needs to be uploaded?"
- "Is KYC required for shareholder?"
- "Why is Shareholding Pattern not showing?"

Important RAG Interpretation

If a user says **"51% shareholders"**, **"51% holding"**, **"ownership 51%"**, **"shareholder details for file login"**, or **"shareholding required for login"**, the chatbot should associate the query with the **Shareholding Pattern** stage and the requirement that the Shareholding Percentage should be **51% for file login**.

If a user says **"shareholder should be co-applicant?"**, the chatbot should explain that **being a shareholder does not automatically require the person to be a Co-Applicant**; the Shareholding Pattern form separately captures the **Is Co-Applicant** Yes/No field.

If a user asks **"Why can't I see Shareholding Pattern?"**, the chatbot should first check the **Main Applicant type**. The stage is applicable to **Company and Firm** applicants and not to **Individual or Trust** applicants.

Reference Details — RAG Knowledge Base Description

Stage Name : reference details

Stage Position in Loan Journey

Reference Details follows the Collateral Details stage in the loan application journey.

The sequence relevant to these stages is:

Shareholding Pattern → Collateral Details → Reference Details → Pending Documents for Login

For applicants where Shareholding Pattern is applicable, the Reference Details stage comes after Collateral Details. Reference Details is applicable to all applicant types, irrespective of whether Shareholding Pattern was applicable.

The Reference Details stage requires two compulsory reference points to be provided before the application can proceed through the applicable process.

Reference Details

Reference Details is a mandatory stage in the loan application journey applicable to **all types of applicants**. The stage requires the applicant to provide **two reference points**, where each reference point represents a person who can be contacted if the loan borrower/applicant or Co-Applicant becomes a defaulter.

The purpose of collecting references is to provide the sales team with additional contact points associated with the applicant. If the borrower/applicant or Co-Applicant defaults on the loan, these reference persons may be contacted by the sales team.

Reference Details is therefore a **contact/reference information stage** and should not be treated as a Co-Applicant or guarantor-creation stage.

Applicability

Reference Details is applicable to **all applicant types**.

It is not restricted based on whether the Main Applicant is:

- Individual
- Company
- Firm
- Trust

The stage can also be relevant where the application contains a Co-Applicant.

The chatbot should **not ask the user to determine applicant type before explaining Reference Details**, because this stage is applicable across applicant types.

Number of References Required

Two references are compulsory.

The applicant must provide **2 reference points** to complete the Reference Details stage.

The required structure is:

Reference 1 → Mandatory

Reference 2 → Mandatory

A single reference is not sufficient to satisfy the requirement.

If the user asks:

"How many references are required?"

The correct response is:

Two references are compulsory for the Reference Details stage.

The RAG model should not state that one reference is sufficient or that additional references are mandatory beyond the two required references.

Who Can Be Added as a Reference?

A reference can be a person known to the applicant, such as:

- Neighbour
- Friend
- Colleague
- Relative

The reference should be a person who can potentially be contacted if the applicant/borrower or Co-Applicant becomes a defaulter.

The reference is therefore a **contact person for reference purposes** and should not automatically be interpreted as:

- Co-Applicant
- Guarantor
- Borrower
- Shareholder

The relationship between the applicant and the reference is captured through the **Relation** field.

Reference Details Captured

For each reference point, the applicant needs to provide the following information:

First Name

The **First Name** of the reference person must be provided.

Middle Name

The **Middle Name** of the reference person must be provided where applicable.

Surname

The **Surname** of the reference person must be provided.

The name information identifies the person being provided as the reference.

Address

The **Address** of the reference person must be provided.

This captures the address associated with the reference point and helps identify/contact the reference person.

Pincode

The **Pincode** associated with the reference person's address must be provided.

The Pincode forms part of the reference person's address information.

Relation

The **Relation** field identifies the relationship between the applicant and the reference person.

Examples of possible relationships include:

- Neighbour
- Friend
- Colleague
- Relative

The exact available values in the system should be taken from the configured application screen if a fixed dropdown list exists. The RAG model should not invent additional system values that are not confirmed by the process documentation.

Contact

The **Contact** field captures the contact information of the reference person.

This contact information is required so that the reference can be contacted when required.

Reference Validation

Reference details are **validated from the Sales end**.

The validation is performed **manually by the Sales team**.

There is **no system-based validation or automated system update** associated with the reference validation according to the provided business process.

Therefore, the chatbot should understand the distinction between:

Reference details entered → Sales team manually validates the references

and should **not describe the process as an automated system verification**.

The system does not automatically confirm the validity of the reference merely because the reference details have been entered.

Purpose of Reference Details

Reference information is collected as an additional contact mechanism associated with the loan applicant.

If the **loan borrower/applicant or Co-Applicant becomes a defaulter**, the provided references may be contacted.

The purpose is therefore related to **contacting/reference tracing in case of default**.

The chatbot should not describe the reference as being responsible for repayment or as guaranteeing the loan unless separate business rules explicitly state this.

A reference is **not automatically a guarantor**.

Reference vs Co-Applicant

A Reference and a Co-Applicant are different concepts.

A **Co-Applicant** is part of the loan application structure.

A **Reference** is a person provided as a contact/reference point who may be contacted if the borrower/applicant or Co-Applicant becomes a defaulter.

Therefore:

Reference ≠ Co-Applicant

and

Reference ≠ Guarantor

unless a separate business rule specifically establishes such a relationship.

The RAG model should not tell users that adding a reference makes that person responsible for the loan.

Reference Details Completion Rule

The Reference Details stage requires **two reference points**.

The application should have:

Reference 1 + Reference 2

before the Reference Details requirement can be considered fulfilled.

Each reference should contain the required information:

First Name + Middle Name + Surname + Address + Pincode + Relation + Contact

The references are subsequently subject to **manual Sales-end validation**.

RAG Decision Rules

The chatbot should follow these rules when responding to Reference Details queries:

1. **Reference Details is applicable to all types of applicants.**
2. **Two references are compulsory.**
3. A reference can be a **neighbour, friend, colleague, or relative**.
4. Each reference requires relevant personal and contact information.
5. Required reference information includes **First Name, Middle Name, Surname, Address, Pincode, Relation, and Contact**.
6. The purpose of references is to provide additional contact points that may be contacted if the borrower/applicant or Co-Applicant becomes a defaulter.
7. Reference details are **validated manually from the Sales end**.
8. Reference validation is **not an automated system validation**.
9. There are **no system updates associated with manual reference validation**, based on the provided process.
10. A reference should not be described as a **Co-Applicant**.
11. A reference should not be described as a **guarantor** unless another documented business rule specifically states this.
12. One reference is not sufficient because **two references are compulsory**.
13. The chatbot should not claim that the system automatically validates whether a reference is genuine, reachable, or related to the applicant.
14. The chatbot should not claim that the reference is financially responsible for the loan or responsible for repayment.

RAG Terminology and Query Understanding

The following terms should map to the **Reference Details** stage:

Reference Details, Reference Detail, Reference, References, Reference Point, Reference Points, Reference Person, Contact Reference, Reference Contact, Sales Reference, Reference Validation, Reference Verification, Two References, 2 References

Common user queries may include:

- "What is Reference Details?"
- "What is the reference stage?"
- "What are reference details?"
- "How many references are required?"
- "How many reference points do I need?"
- "Are 2 references compulsory?"
- "Can I provide only one reference?"
- "Who can be a reference?"
- "Can I add my friend as reference?"
- "Can I add my neighbour as reference?"
- "Can I add my colleague as reference?"
- "Can I add my relative as reference?"
- "What details are required for reference?"
- "What information should I enter for reference?"
- "What is required in reference details?"

- "What is the relation field?"
- "Whose contact number should I enter?"
- "Whose address should I enter?"
- "Is Reference Details applicable for Individual?"
- "Is reference required for Company?"
- "Is reference required for Firm?"
- "Is reference required for Trust?"
- "Is reference mandatory?"
- "Who validates the reference?"
- "How is reference verified?"
- "Does the system verify references?"
- "Is reference verification automatic?"
- "Sales has to validate the reference?"
- "What happens if the applicant defaults?"
- "Why do we take reference details?"
- "Will the reference person be contacted?"
- "Does reference become responsible for the loan?"
- "Is reference same as co-applicant?"
- "Is reference same as guarantor?"

Important RAG Responses

If the user asks: "How many references are required?"

Two references are compulsory in the Reference Details stage.

If the user asks: "Who can be a reference?"

A reference can be a person known to the applicant, such as a neighbour, friend, colleague, or relative.

If the user asks: "Is Reference Details only for companies?"

No. Reference Details is applicable to all types of applicants.

If the user asks: "Is reference verification automated?"

No. Reference details are validated manually from the Sales end. There is no automated system validation or system update for this reference validation process.

If the user asks: "Why are references required?"

References provide additional contact points. If the borrower/applicant or Co-Applicant becomes a defaulter, the provided reference persons may be contacted.

If the user asks: "Does the reference become responsible for the loan?"

No. A reference is a contact/reference person and should not be treated as a Co-Applicant or guarantor based solely on being provided as a reference.

Income Verification (IV) — RAG Knowledge Base Description

Stage Name

Income Verification (IV)

Income Verification (IV) is a stage in the loan application journey used to verify the **banking and financial information of applicants and Co-Aplicants whose income is being considered for the loan assessment**.

The stage follows **Initial Money Deposit (IMD)**.

The relevant journey sequence is:

Initial Money Deposit (IMD) → Income Verification (IV) → Reference Details → Collateral Details (if applicable) → Pre-Login Documents

Income Verification (IV) is therefore performed before the application moves to Reference Details and, where applicable, Collateral Details and subsequently Pre-Login Documents.

Applicability of Income Verification (IV)

Income Verification (IV) is applicable to **financial Applicants and financial Co-Aplicants**.

A person is considered financially relevant for this stage when their income is being considered in the loan application and **"Has Income?" is selected as "Yes" in Quick Data Entry (QDE)**.

Therefore:

- **Applicant + Has Income = Yes → Income Verification (IV) applicable**
- **Co-Aplicant + Has Income = Yes → Income Verification (IV) applicable**
- **Has Income = No → Income is not considered for that person through this income-verification process**

The RAG model should use the **Has Income? selection from Quick Data Entry** when determining whether Income Verification (IV) applies to a particular Applicant or Co-Aplicant.

Purpose of Income Verification (IV)

The purpose of Income Verification (IV) is to obtain and verify the applicant's **banking/financial information** that is relevant to the income and financial assessment of the loan application.

The process involves providing banking details and obtaining the required banking statement/data through one of the available verification methods.

The stage should therefore not be described merely as uploading a bank statement. It provides multiple methods through which the applicant's banking information can be accessed or submitted.

Banking Verification

In the SkaleUp loan application context, Banking, Bank Verification, and Banking Verification all refer to the Income Verification (IV) stage; they are not separate stages.

Within the Income Verification (IV) stage, the system displays a **Banking Verification** process.

The Banking Verification screen captures the banking information required for the applicant whose income is being verified.

The following information is captured:

Applicant Name

The **Applicant Name** identifies the applicant for whom banking verification is being performed.

The field is mandatory.

The system displays the applicant name in the banking verification screen.

Bank Name

Bank Name identifies the bank account from which the banking information is to be obtained.

The field is mandatory.

The applicant selects the relevant bank from the available options.

Type of Account

Type of Account identifies the type of bank account being verified.

The field is mandatory.

The screenshot shows **Savings** as an example of the selected account type.

Account Holding

Account Holding identifies whether the bank account is held individually or jointly.

The field is mandatory.

The available options shown are:

- **Single**
- **Joint**

Banking Statement Period

The user must select the **Banking Statement Period** for which banking information is required.

The system captures the period through:

- **Date From**
- **Date To**

Both dates are mandatory.

The screen also displays the instruction:

"Kindly ensure the Banking period is as per the policy for an eligible Product to be mapped."

Therefore, the banking statement period should be selected according to the applicable policy for the eligible product.

The RAG model should **not assume a fixed number of months** unless a specific product policy or additional source document defines the required period.

Banking Verification Methods

After providing the required banking information, the applicant can access or submit the banking data using the available verification methods.

The screen provides **four methods**:

1. **Account Aggregator**
2. **Net Banking**
3. **E-Statement**
4. **Scanned Statement**

Account Aggregator

Account Aggregator is displayed as the **Recommended** method.

The screen describes Account Aggregator as a simple and secure way to access and share financial data.

The displayed instructions state that:

- The applicant can access and share financial data through the Account Aggregator method.

- The applicant's **mobile number needs to be linked with the GSTIN account**.
- The applicant selects the bank account that they want to access.

The applicant can proceed using the **Proceed** option provided under Account Aggregator.

The RAG model should identify **Account Aggregator as the recommended method** based on the displayed application screen.

Net Banking

Net Banking is available as another method for banking verification.

The screen describes Net Banking as a secure approach where credentials are not stored and provides instant verification without documentation.

The applicant can proceed with the **Proceed With Net Banking** option.

For RAG purposes, Net Banking should be understood as a method where the applicant authenticates/accesses their banking information through the bank's net-banking process.

The RAG model should **not claim that username and password are always required for every Income Verification (IV) method**. The requirement depends on the selected verification method.

E-Statement

E-Statement is an alternative method for providing banking information.

Under this method, the applicant downloads the required bank statements and **uploads them manually**.

The screen describes this method as a secure approach where the applicant downloads their bank statements and uploads them.

The applicant can use the **Proceed** option under E-Statement.

Scanned Statement

Scanned Statement is another method of providing banking information.

Under this method, the applicant provides the required bank statement by **uploading it manually**.

The applicant can use the **Upload Now** option to provide the scanned bank statement.

Important Distinction Between Verification Methods

The RAG model should understand that **Income Verification (IV) does not mean that the applicant must always log in using bank username and password**.

The process provides multiple methods:

Account Aggregator → Recommended

Net Banking → Online banking verification

E-Statement → Download statement and upload manually

Scanned Statement → Upload statement manually

Therefore, if the user asks:

"Does the applicant have to enter bank username and password?"

The appropriate response is:

Not necessarily. Income Verification (IV) provides multiple banking-verification methods. Net Banking may involve bank authentication, while Account Aggregator, E-Statement, and Scanned Statement provide other methods of accessing or submitting the required banking information.

Income Verification (IV) and Financial Applicant

Income Verification (IV) should be associated with the person whose income is being considered for the loan.

The relevant person may be:

Main Applicant

or

Co-Applicant

The deciding factor is the **Has Income?** selection made during Quick Data Entry.

For example:

If a Co-Applicant has **Has Income = Yes**, the Co-Applicant's banking/financial information can be subject to Income Verification (IV).

The RAG model should not assume that Income Verification (IV) is restricted only to the Main Applicant.

Stage Sequence

Income Verification (IV) follows **Initial Money Deposit (IMD)**.

After Income Verification (IV), the application proceeds to:

Reference Details

After Reference Details:

Collateral Details may be applicable depending on the application/product.

After the applicable Collateral Details stage:

Pre-Login Documents

Therefore, the relevant sequence is:

Initial Money Deposit (IMD) → Income Verification (IV) → Reference Details → Collateral Details (if applicable) → Pre-Login Documents

Reference Details is applicable to all applicant types, while Collateral Details is applicable only where required by the application/product.

RAG Decision Rules

The chatbot should follow these rules when answering Income Verification (IV) queries:

1. **Income Verification (IV) follows Initial Money Deposit (IMD).**
2. Income Verification (IV) is performed for **financial Applicants and financial Co-Applicants** whose income is considered.
3. The relevant indicator is **Has Income? = Yes** in Quick Data Entry (QDE).
4. Income Verification (IV) is not limited only to the Main Applicant.
5. The process includes **Banking Verification**.
6. Banking Verification captures Applicant Name, Bank Name, Type of Account, Account Holding, and Banking Statement Period.

7. Banking Statement Period is captured using **Date From and Date To**.
8. The banking period must be selected according to the applicable product policy.
9. The system provides four banking verification methods:
 - Account Aggregator
 - Net Banking
 - E-Statement
 - Scanned Statement
10. **Account Aggregator is displayed as the Recommended method.**
11. Account Aggregator requires the mobile number to be linked with the GSTIN account according to the displayed instructions.
12. Net Banking provides an online banking-verification method.
13. E-Statement requires the applicant to download bank statements and upload them manually.
14. Scanned Statement requires the applicant to upload the bank statement manually.
15. The applicant does **not necessarily have to use username/password authentication**, because multiple verification methods are available.
16. The RAG model should not state a fixed banking period unless the applicable product policy specifies it.
17. The RAG model should not invent additional banking-verification methods that are not documented.
18. The stage is followed by **Reference Details**, then **Collateral Details where applicable**, and then **Pre-Login Documents**.

RAG Terminology and Query Understanding

The following terms should map to the **Income Verification (IV)** stage:

Income Verification (IV), Income Verification Group, IV, Income Verification Stage, Banking Verification, Banking Verification Stage, Bank Verification, Banking Details, Bank Statement Verification, Financial Verification, Income Proof, Banking Period, Bank Statement Period, Account Aggregator, AA, Net Banking, E-Statement, Scanned Statement.

The RAG model should understand that **Income Verification (IV) Group** is the terminology shown in the application tracker, while **Banking Verification** is the terminology shown on the banking verification screen.

Common User Queries

The RAG model should be able to answer queries such as:

- "What is Income Verification (IV)?"
- "What happens in Income Verification (IV)?"
- "What is Income Verification (IV)?"
- "What is Income Verification (IV) Group?"
- "When does Income Verification (IV) happen?"
- "Does Income Verification (IV) come after Initial Money Deposit (IMD)?"
- "Who needs Income Verification (IV)?"
- "Is Income Verification (IV) required for the applicant?"
- "Is Income Verification (IV) required for Co-Applciant?"
- "Has Income is Yes, what happens next?"
- "Where is Has Income selected?"
- "What is Banking Verification?"
- "What details are required for banking verification?"
- "What is Banking Statement Period?"

- "What should I enter in Date From and Date To?"
- "What is Account Holding?"
- "What is Single and Joint account?"
- "How can I verify bank details?"
- "How can I submit bank statement?"
- "What is Account Aggregator?"
- "Is Account Aggregator recommended?"
- "Can I use Net Banking?"
- "Can I upload E-Statement?"
- "Can I upload scanned bank statement?"
- "Do I need bank username and password?"
- "Can I manually upload bank statement?"
- "What comes after Income Verification (IV)?"
- "Does Income Verification (IV) happen before Reference Details?"
- "Does Collateral come before or after Income Verification (IV)?"

Important RAG Responses

If the user asks: "Who needs Income Verification (IV)?"

Income Verification (IV) is performed for financial Applicants and Co-Applicants whose income is being considered for the loan. This is determined through the **Has Income?** selection in Quick Data Entry (QDE).

If the user asks: "Does Income Verification (IV) come after Initial Money Deposit (IMD)?"

Yes. Income Verification (IV) follows the Initial Money Deposit (IMD) stage.

If the user asks: "What comes after Income Verification (IV)?"

Reference Details follows Income Verification (IV). After Reference Details, Collateral Details is completed if applicable, followed by Pre-Login Documents.

If the user asks: "Does the applicant have to login with username and password?"

Not necessarily. The Income Verification (IV) process provides multiple methods for obtaining banking information: Account Aggregator, Net Banking, E-Statement, and Scanned Statement. Net Banking may involve bank authentication, while E-Statement and Scanned Statement involve manual statement submission.

If the user asks: "Which method is recommended?"

Account Aggregator is displayed as the recommended method on the Banking Verification screen.

If the user asks: "Can I upload the bank statement manually?"

Yes. The process provides **E-Statement** and **Scanned Statement** methods where the applicant can download/provide the bank statement and upload it manually.

If the user asks: "Is Income Verification (IV) only for applicants?"

No. Income Verification (IV) can apply to both the Main Applicant and Co-Applicant when their income is being considered and **Has Income?** is selected as Yes.

If the user asks: "What banking period should I enter?"

The Banking Statement Period should be entered according to the applicable policy for the eligible product. The system captures the period using **Date From** and **Date To**. A fixed period should not be assumed unless specified by the applicable product policy.
